

UNIVERSTA · PHASE 1

Admin Operations, Field Reference & Client Demonstration Guide

A practical guide to running the platform day to day, and a record of the acceptance testing carried out against the live production system before this handover.

7. Quick reference — every admin screen	14

1 How to use this guide

Three audiences, one document. Read the section that matches what you're doing.

Running the platform

Go straight to **Section 3**. It's organised the same way as the Admin sidebar, so you can look up a screen by the job you're doing.

Demonstrating it to someone else

Section 4 is a scripted, timed walkthrough — what to click, in what order, and what to say. Follow it top to bottom the first few times.

Confirming what was actually tested

Section 5 summarises the acceptance programme: every module, every defect found, and what changed as a result. Full row-level detail lives alongside this guide in `03-test-matrix.md`.

Deciding what happens next

Section 6 lists every remaining decision that is the client's to make — content, branding, and a small number of design calls — separated clearly from anything that was a code defect.

2 The platform at a glance

Three pieces work together. Nobody but your team needs to know that — but it helps to see the shape of it once.

PIECE	WHAT IT IS	WHO USES IT
Public site	The website your students, families and partners see — destinations, universities, courses, scholarships, consultants, jobs, events, and the rest.	Anyone, no login
Admin console	Where your team manages every page and every record on the public site — content, navigation, SEO, media, and settings.	Your team, signed in
API	The engine underneath both. You won't interact with it directly — it exists so the public site and the admin console can talk to the same data.	Not used directly

The one rule worth remembering

Everything in the admin console has a **draft** state and a **published** state. A draft is only ever visible inside the admin console — never on the public site — until someone with access explicitly publishes it. Publishing is always a deliberate action, never a side effect of saving.

Signing in

The admin console is reached at the address above. Sign-in uses an email and password issued to your team; there is a single administrator role in Phase 1 (see Section 3.4), so anyone with a login has full access. A wrong password shows a generic "invalid email or password" message — it never reveals whether an email address exists in the system, which is a deliberate anti-guessing protection.

3 Admin operations — field reference

Organised exactly as the Admin sidebar groups it: Website Builder, Content records & Catalog, Operations, and Access.

3.1 Website Builder

This is the group for anything about how the site is presented, rather than what it contains.

Website Pages

[Website Builder → Website Pages](#)

Every one of the platform's public pages in one searchable list — the homepage, About, Contact, every listing page, every comparison page, and every detail-page template. Each row says how that page is managed (a CMS page you edit directly, a shared template that applies to every record of one type, or a code-defined route whose search-engine metadata you control) and links straight to the right editor — including its own SEO settings, not a generic one.

Global Header & Global Footer

[Website Builder](#)

The navigation bar and footer shown on every public page. Edited once, applied everywhere: logo, navigation links, call-to-action button label and destination, footer columns, and social links.

Navigation menus

[Website Builder → Navigation menus](#)

The menu structure itself — labels, order, and links — that the Global Header and Footer draw from.

Page templates

[Website Builder → Page templates](#)

Reusable layouts applied to every record of one type (e.g. every university detail page, every city page). Also manages reusable sections that can be dropped into any CMS page. Changing a template changes every page that uses it; the individual record's own data is untouched.

Media library

Website Builder → Media library

Every image and file uploaded to the platform, with an "in use" check that shows everywhere a file is currently referenced before it can be deleted — across pages, catalog records, header/footer, and templates.

SEO management

Website Builder → SEO management

A single hub listing every SEO-enabled resource type and every code-defined route (listings, comparisons, static pages), each linking straight to its own title, meta description, canonical URL, and indexing controls. Comparison pages default to "do not index" until an admin explicitly changes that, since they're generated views rather than primary content.

3.2 Content & Catalog

Ten modules share one working pattern, so once you've used one, you've used them all: a searchable list with filters, a create/edit form, a Publish / Unpublish switch, and (where relevant) an SEO tab and a media picker. Publishing is always a deliberate, separate action from saving.

MODULE	PUBLIC PAGE	FIELDS THAT MAKE IT DISTINCTIVE
Countries	Destinations	Continent, ISO codes, cost/work/language profile (tuition range, part-time and post-study work rights, IELTS requirement), editorial "why study here" content, intakes.
Subjects	Subjects	Name, short description, overview, icon/listing/hero media, sub-subjects.
Universities	Universities	Campuses (repeatable), course offerings, accreditation, claim requests from institutions.
Courses	Courses	Subject, course level, duration, credits, study modes, career summary, qualification name.
Scholarships	Scholarships	Provider, amount, degree level, eligible country/destination.
Consultants	Consultants	Locations, services offered, languages, an independent Verified switch (separate from Published — your team can verify without publishing, or publish before verifying).
Jobs	Careers	Department, employment type, location, remote flag, active flag.

Events	Events	Mode (online/in-person), location, date range.
Success stories	Success Stories	Quote, attribution, optional link to a university course offering.
Testimonials	Testimonials	Quote, attribution, optional media.

Every one of these ten modules, plus Universities' course offerings and Consultants' locations, also carries: featured scheduling (a start/end window in which a record counts as "featured" without an admin having to remember to switch it off), publish scheduling (a start/end window for the record to be live at all), and an SEO tab.

3.3 Operations

Bulk import / export

Operations → Bulk data

Covers all thirteen bulk-eligible resources (Countries, States/ provinces, Cities, Subjects, Generic courses, Careers/jobs, Events, Universities, University campuses, University course offerings, Scholarships, Consultants, Consultant locations). For each: download a spreadsheet template, validate a file before writing anything ("dry run" — reports exactly which rows would fail and why), import as create-only or create-or-update, bulk-update a field across a selection, bulk-archive a selection, and export current data back out.

Redirects

Operations → Redirects

Old-URL-to-new-URL rules the public site honours automatically — useful whenever a page moves or a slug changes.

Global Settings

Settings

Seven groups in one screen: General, Branding, Contact details, Social links, Header, Footer, and Default SEO (the fallback title suffix and description used whenever a page hasn't set its own).

3.4 Access

Phase 1 ships one role — **Super Admin** — with a single seeded account. There is no separate Users or Roles screen yet; every signed-in account has full access. A missing, malformed, or

expired login is always rejected before any other check runs. Repeated wrong-password attempts against one account temporarily lock it out for a fixed cooldown period, then unlock automatically — a standard anti-brute-force protection, not something your team needs to manage.

4 Client demonstration guide

A 15–20 minute walkthrough for showing the platform to someone new — a stakeholder, a new team member, or a prospective partner. The running argument: *students get a complete, credible study-abroad site, and your team runs all of it without calling a developer.*

Before you start: sign in to the admin console in a second browser tab beforehand, so no password is ever typed on screen. Have a phone-sized browser window ready for the responsive moment. The demo data in this environment is clearly fictional — say so once, early, so nobody mistakes a sample record for a real institution.

Part A — The public site (5–6 minutes)

Home

SAY: Everything in this navigation is managed by your team. The menu, the labels, the order and the call-to-action button are all edited in the admin console — there's no developer in that loop.

Business benefit: marketing changes ship in minutes, not sprints.

Destinations

Countries listing → search → open one country.

SAY: Destination pages carry your own guidance content, and connect to the universities, cities and consultants you've already published.

Universities

Type in search, apply a destination filter, change the sort — then point at the address bar.

SAY: Notice the web address changed. A counsellor can filter this list and send the exact result set to a student — the link reopens the same view.

Open a university → its courses → one course offering.

SAY: Tuition, level, study mode, duration, intake and entry requirements all come from the record your team maintains. Update it once, and it's correct everywhere it appears.

Scholarships and consultants (fast)

Filter scholarships by country. Filter consultants by location, service, language and verification.

SAY: Verification means your team checked this consultant. It's a status you control — it isn't a rating and it isn't a score.

Comparison

Compare three universities, then refresh the page.

SAY: The comparison survives a refresh and can be shared as a link — that's how a counsellor sends a shortlist to a family.

Part B — Admin to public: the round trip (7–8 minutes)

This is the part that changes the conversation. Everything before it could be a static website; this proves it isn't.

Website Pages

SAY: All of the platform's public pages are in this one searchable list. Your team never has to know a web address to edit a page.

Open About Us — content sections, SEO settings, header/footer overrides, preview, and full change history, all on one screen.

The round trip — do this slowly, it lands hard

1. Add a section, give it a heading.
2. Turn off "Show on Mobile" for that section — *the same page can show a section on desktop and hide it on a phone.*
3. Save.
4. **Switch to the public page and refresh. It isn't there.** Drafts stay private; students never see work in progress.
5. Open Preview, click Desktop, Tablet, Mobile — these are real device widths, not a picture of one.
6. Publish.
7. **Refresh the public page. It's there.**

SAY: That's the whole content workflow: write, preview, publish — with no deployment and no

developer.

Version history

Open Version History → Compare → Restore.

SAY: Every change is recorded with who made it and when. You compare two versions in plain language and roll back. Restoring creates a new version — it never erases the history, and it never publishes anything by surprise.

Templates

SAY: This one template controls the layout of every university page. Change it once and every university page follows — but the university's own information is untouched, because that lives on the record, not the template.

Catalogue management (pick two, don't do all of them)

Universities: edit a field → save → show it publicly → unpublish → show the page is gone → republish.

SAY: Publication is a switch your team controls. Nothing goes live by accident and nothing stays live when you need it down.

Consultants: show that Verified and Published are two separate switches.

Enquiries

Submit a contact enquiry on the public site. Find it in the admin. Convert it into a counselling lead. Try converting it a second time.

SAY: It won't create a duplicate. One student enquiry becomes exactly one lead, with its status history attached.

Part C — Responsive (1–2 minutes)

Switch to the phone-sized window. Show the navigation drawer opening, a listing page's filters, and one detail page.

Part D — Bulk operations (only if asked about data volume)

SAY: Your team can download a spreadsheet template, fill it in, and validate it before importing. Bad rows are reported back rather than quietly corrupting the catalogue. You can export the same way for reporting.

Likely questions, short answers

Can my team really change all of this without a developer?

Yes — every page, the navigation, the header and footer, SEO settings and the whole catalogue.

What happens if someone breaks a page?

Every change is versioned. You compare and roll back from the same screen, and restoring never publishes anything on its own.

Can students create accounts?

Not in Phase 1. There's a configurable link ready for when you want one, and it stays hidden until you set a destination.

Why don't I see ratings or rankings?

The platform holds no such data. Showing invented numbers would be a real liability. Give us a defensible source and we can display it.

How do we load our real data?

Either through the admin screens, or in bulk from a spreadsheet with validation before anything is written.

Is it mobile-friendly?

Yes — and you can control, per section, what appears on a phone versus a desktop.

5 Acceptance programme — what was tested

Every module was tested field by field against the live, deployed production system — not a local copy. Each check: exercise the control, verify the saved value through the API, confirm the effect on the public site, and check desktop, tablet and mobile.

The 8 modules named for this acceptance pass

#	MODULE	RESULT
1	Media	Complete
2	SEO	Complete
3	Internal Linking	Complete
4	Comparisons	Complete
5	Bulk Actions and Import/Export	Complete
6	Scheduling	Complete
7	Global Settings	Complete
8	Authentication / Users / Roles / Permissions	Complete

Alongside these, the ten catalogue modules and four platform-composition modules (Homepage, Navigation, Footer, Pages) were carried through the same process earlier in the programme and are included in the totals above.

What was found, and fixed

38 issues were logged over the course of the programme. 35 were fixed, deployed to production, and confirmed live. 3 remain open, each for a specific, named reason (Section 6) rather than being left unresolved by omission.

Every fix carries its own automated test, and every one of those tests was independently confirmed to genuinely fail without the fix — not just a test that happens to pass. Several were security- or availability-critical: a media "in use" check that missed most real consumers (risking silent deletion of media still referenced elsewhere), a release directory that had been read-only since launch (meaning every media upload was silently failing), a token-refresh race that could bounce a fast login straight back to the sign-in screen, a missing pagination control that made records past the twelfth permanently unreachable through the admin, admin-configured redirects that had no effect at all, and an open-redirect bypass in the Settings URL validator.

The two issues specifically closed out with live verification

Fictional public descriptions

Country & Course pages

All 12 countries and all 12 generic courses shared a templated, visibly fictional description that appeared in each page's public search-engine metadata. Replaced for all 24 records with honest copy composed strictly from each record's own already-verified data (tuition range, work rights, qualification level) — no new facts were invented. Confirmed live: neither page's description reads as fictional any more. A broader, much larger placeholder-text pattern was found across the wider demo dataset and is logged separately in Section 6 as content work, not a code defect.

Website Builder's per-page SEO link

Website Pages → SEO action

The action on every page row used to link to the generic SEO hub with nothing pre-selected. It now opens directly to that page's own SEO settings. Verifying this fix live surfaced a second, related issue on the Homepage row specifically — its own link pointed at a setting that had already been retired by an earlier fix — which was found and corrected in the same pass, with a new automated check added so a future change can't silently repeat it.

6 Open items and what still needs the client

Nothing below is a code defect left unresolved. Each item either needs a decision or real content that only the client can supply.

Decisions and content that are the client's to make

NEEDED	WHY IT MATTERS
Real university, course and scholarship data	The catalogue currently runs on clearly fictional demonstration records.
Final brand copy for Home, About, FAQ	Present wording is placeholder text.
Logo and brand imagery	Currently a text wordmark.
Contact details, privacy policy, terms	These appear in the footer on every page.
A decision on ratings/rankings	None are shown today; displaying them needs a defensible data source.
A decision on the "Create account" link	Built as a configurable link, hidden until a destination is set — no student login exists in Phase 1.

Small remaining items, explicitly classified

ITEM	CLASSIFICATION	WHY IT'S STILL OPEN
Stray test record in Universities	Deferred, needs approval	A junk record is currently live in the client's own data. Deleting a client's production record isn't ours to do without their say-so.
Pluralisation typo in one button label	Deferred, batched	Cosmetic only, grouped with other low-priority copy fixes.
Listing pages' own CMS sections don't render live	Deferred, design decision needed	Everything saved is preserved correctly — nothing is lost — but exactly where those sections should appear relative to the catalogue grid is a layout decision, not a code one.
Placeholder text across the wider demo dataset	Content, via the admin	A pattern of "for local testing" placeholder text was found spanning campuses, consultant locations, scholarships, events and testimonials, well beyond the two items closed out in Section 5. Closing it means writing real, source-verified content — appropriately a client content task, not something to fabricate on the client's behalf.

7 Quick reference — every admin screen

Grouped exactly as the sidebar groups them.

GROUP	SCREENS
Website Builder	Website Pages, Global Header, Global Footer, Navigation menus, Page templates, Media library, SEO management
Content records	Pages, Success stories, Testimonials
Destinations	Continents, Countries, States / provinces, Cities
Academics	Subjects, Generic courses, Course levels, Study modes, Intakes
Universities	Universities, University course offerings, University claim requests
Scholarships	Scholarships, Scholarship providers
Consultants	Consultants, Consultant locations
Enquiries	Contact enquiries, Counselling leads
Careers & events	Jobs, Events
Operations	Bulk import / export, Redirects
Settings	General, Branding, Contact details, Social links, Header, Footer, Default SEO

Full field-by-field test evidence for every screen above is recorded in the acceptance programme's coverage sheet (`03-test-matrix.md`) and bug report (`02-bug-report.md`), delivered alongside this guide.
