

INTERNAL · NOT FOR THE CLIENT

Phase 1 Demo Script

The exact click path and talking points for showing the live platform — to a stakeholder, a new hire, or a prospective partner. Timed for 15–20 minutes.

COLLEAGUE COPY — INCLUDES TROUBLESHOOTING NOTES

Public site — 54.162.49.131.nip.io

Admin console — admin.54.162.49.131.nip.io

Before you start

Five minutes of prep saves you from every awkward moment in the demo itself. Do all of this before the other person joins the call or sits down.

- ☐ Sign in to the admin console in a **second browser tab** beforehand — so you never type a password on screen.
- ☐ Open the public site in the **first tab**, at roughly 1440×900. Close unrelated tabs, the bookmarks bar, and any terminal window.
- ☐ Have a phone-sized window ready (resize the browser to ~390×844, or use dev tools' device toolbar) for the responsive moment in Part C.
- ☐ Know which record you'll edit live: **a real published university** for the catalogue-management moment, and **About Us** for the round-trip moment. Don't decide on the spot.
- ☐ Say once, early, that the catalogue is running on demo data — some records are clearly fictional (e.g. any name that reads as a placeholder). This is expected in this environment and protects you from an awkward "is that real?" moment later.

IF THIS HAPPENS: If you can't remember whether a demo record is "safe" to publish/unpublish live, use one you created yourself for testing rather than a client-owned or unfamiliar record. Toggling Published/Unpublished on a real record is reversible, but don't do it on anything you're not sure about.

The one-sentence pitch (say this first, every time)

SAY IT LIKE THIS: Students get a complete, credible study-abroad site, and your team runs all of it without calling a developer.

Everything in this script exists to prove that one sentence. If you only remember one thing, make it this.

PART A

The public site

5–6 min

Show what a student sees first. Move quickly here — the real payoff is Part B.

Home

Open the home page. Point at the header.

SAY IT LIKE THIS: Everything in this navigation is managed by your team. The menu, the labels, the order and the call-to-action button are all edited in the admin console — there's no developer in that loop.

Scroll to the footer. Same point, briefly. **Business benefit:** marketing changes ship in minutes, not sprints.

Destinations

Countries listing → search → open one country.

SAY IT LIKE THIS: Destination pages carry your own guidance content, and connect to the universities, cities and consultants you've already published.

Show breadcrumbs and the counselling call-to-action.

Universities

On the Universities listing: type in search, apply the destination filter, change the sort. Then point at the address bar.

SAY IT LIKE THIS: Notice the web address changed. A counsellor can filter this list and send the exact result set to a student — the link reopens the same view.

Open a university → its courses → one course offering.

SAY IT LIKE THIS: Tuition, level, study mode, duration, intake and entry requirements all come from the record your team maintains. Update it once, and it's correct everywhere it appears.

Business benefit: one source of truth; no stale duplicates across pages.

Scholarships and consultants (fast — don't linger)

Scholarships listing — filter by country, open one. Consultants listing — filter by location, service, language, destination and verification.

SAY IT LIKE THIS: Verification here means your team checked this consultant. It's a status you control — it isn't a rating and it isn't a score.

IF THIS HAPPENS: If asked about ratings or rankings anywhere on the site: we deliberately don't display them. The platform doesn't hold that data, and showing invented numbers would be a real liability. When there's a real, defensible source, we can surface it.

Comparison

30 sec

Open a comparison with three universities. Refresh the page.

SAY IT LIKE THIS: The comparison survives a refresh and can be shared as a link — that's how a counsellor sends a shortlist to a family.

Admin to public: the round trip

7–8 min

Everything before this could be a static website. This is what proves it isn't. Slow down here — this is the section that changes the conversation.

The console

SAY IT LIKE THIS: Only authorised team members can get in here. The sidebar is grouped by the job you're doing, not by how the software is built.

Website Builder → Website Pages

Open Website Builder → Website Pages.

SAY IT LIKE THIS: All of the platform's public pages and page templates are in this one searchable list. Your team never has to know a web address to edit a page.

Open **About Us**.

SAY IT LIKE THIS: Everything for this page is on one screen — the content sections, the search engine settings, the header and footer overrides, preview, and the full change history.

The round trip — do this slowly, it lands hard

1. Add a section and give it a heading.
2. Turn off "**Show on Mobile**" for that section.

SAY IT LIKE THIS: The same page can show a section on desktop and hide it on a phone.

3. Save.
4. **Switch to the public page and refresh. It isn't there.**

SAY IT LIKE THIS: Drafts stay private. Students never see work in progress.

5. Back in the Builder, open Preview and click Desktop, Tablet, Mobile.

SAY IT LIKE THIS: These are real device widths, not a picture of one.

6. Publish.
7. **Refresh the public page. It's there.**

SAY IT LIKE THIS: That's the whole content workflow: write, preview, publish — with no deployment and no developer.

Version history

Open Version History → Compare → Restore.

SAY IT LIKE THIS: Every change is recorded with who made it and when. You compare two versions in plain language and roll back. Restoring creates a new version — it never erases the history, and it never publishes anything by surprise.

Business benefit: a junior team member can edit confidently, because mistakes are reversible.

Templates — "change one page, change five hundred"

Open University Detail Template. Pick a real university from the preview list.

SAY IT LIKE THIS: This one template controls the layout of every university page. Preview it against any real university. Change it once and every university page follows — but the university's own information is untouched, because that lives on the record, not the template.

Global header and footer

Change the header call-to-action label, save, show the public site, change it back.

SAY IT LIKE THIS: One edit, every page.

Catalogue management (*pick two, don't do all of them*)

Universities: edit a field → save → show it publicly → unpublish → show the page is gone → republish.

SAY IT LIKE THIS: Publication is a switch your team controls. Nothing goes live by accident and nothing stays live when you need it down.

Consultants: show that Verified and Published are two separate switches.

SAY IT LIKE THIS: You can publish a consultant you haven't verified yet, or verify one before you publish. They're independent on purpose.

Enquiries — "where the revenue starts"

Submit a contact enquiry on the public site. Find it in the admin. Convert it into a counselling lead. Try converting it a second time.

SAY IT LIKE THIS: It won't create a duplicate. One student enquiry becomes exactly one lead, with its status history attached.

Business benefit: no double-handling, no lost enquiries.

PART C

Responsive

1–2 min

Switch to the phone-sized window. Show: the navigation drawer opening, a listing page's filters, one detail page.

SAY IT LIKE THIS: Most students will arrive on a phone. The filters, the drawer and the forms are all usable at this size.

PART D — ONLY IF ASKED ABOUT DATA VOLUME

Bulk operations

optional

SAY IT LIKE THIS: Your team can download a spreadsheet template, fill it in, and validate it before importing. Bad rows are reported back rather than quietly corrupting the catalogue. You can export the same way for reporting.

Closing line

SAY IT LIKE THIS: That's the platform end to end — public site, admin console, and the round trip between them. Everything you've just seen is running on the live system right now, not a preview.

Likely questions, ready answers

Answer in one or two sentences. Don't over-explain (see the last page for what to skip entirely).

Can my team really change all of this without a developer?

Yes — every page, the navigation, the header and footer, SEO settings and the whole catalogue.
Offer: bring a laptop next session and have someone from their team make a change live.

What happens if someone breaks a page?

Every change is versioned. You compare and roll back from the same screen, and restoring never publishes anything on its own.

Can students create accounts?

Not in Phase 1. There's a configurable link ready for when they want one, and it stays hidden until a destination is set.

Why don't I see ratings or rankings?

The platform holds no such data. Showing invented numbers would be a real liability. Give us a defensible source and we can display it.

How do we load our real data?

Either through the admin screens, or in bulk from a spreadsheet with validation before anything is written.

Is it mobile-friendly?

Yes — and they can control, per section, what appears on a phone versus a desktop.

How soon can this be live for real users?

Once real content, branding, and a small number of open decisions are settled (see the client field-reference guide's "what still needs the client" section). The platform itself is already deployed and running.

Don't over-explain

Skip these unless someone technical asks directly — they cost time and buy no confidence with a non-technical audience:

- database relationships and publication guards
- token handling and session security
- caching, rendering strategy and build tooling

- test counts and the regression suite
- how preview links are secured

If pressed, one sentence each is plenty — e.g. *"Draft content is protected by short-lived preview links, so it can't leak by someone sharing a URL."*
