

CLIENT · ADMIN USER MANUAL

Phase 1 Client Admin User Manual

A complete, plain-English guide to using the Universta admin panel — every module, every field, every option — so you never have to ask what something means or does.

Document version 1.0 · Prepared August 2026

15. Frequently asked questions	24
16. Getting help	26

1 Introduction

This manual explains everything you need to run the Universta admin panel day to day — no developer required for routine content work.

What the Universta Admin Panel is

A single web application where your team manages every page and every record shown on the public Universta website — destinations, universities, courses, scholarships, consultants, careers, events, and the site's own navigation, header, footer and search-engine settings.

What Phase 1 includes

Content management for all of the above, a shared media library, SEO controls for every page and record, scheduled publishing, and bulk import/export for the larger catalogue types.

Who should use the admin panel

Anyone on your team responsible for keeping the public site's content, navigation, or search-engine presentation up to date.

Basic content publishing workflow

See Section 11 for the full explanation of each step.

Draft, Preview and Published — the difference

STATE	WHAT IT MEANS
Draft	Saved, but not visible to visitors anywhere on the public site.
Preview	What the content will look like once published — visible only inside the admin panel.
Published	Live on the public website, visible to every visitor immediately.

Why checking desktop and mobile matters

Most visitors to the public site will be on a phone. Every page and, for CMS-managed pages, every individual content section can be shown or hidden independently on desktop, tablet, and mobile — so always check what a change looks like on a phone-sized screen before considering it finished.

2 Login and account safety

How to log in

1. Go to the admin console address given to you.
2. Enter your email address and password.
3. Click "Sign in securely".

A wrong password shows a generic "invalid email or password" message — this is deliberate, so it never confirms or denies whether a particular email address has an account.

How to log out

Use the account menu in the top-right corner of the admin panel and choose Sign out. Always sign out on a shared or public computer.

Password safety

- Do not share your administrator password with anyone, including colleagues — Phase 1 does not yet support separate accounts with limited permissions, so anyone with a login has full access to every module.
- Use a unique, strong password, ideally stored in a password manager.
- If you suspect your password has been seen by anyone else, change it immediately.

Use separate accounts where possible. Because every account in Phase 1 currently has identical, full access, treat every login with the same level of care you would give to your most sensitive business system.

What to do if access is lost

Contact whoever administers your hosting/technical relationship to have your access restored or a new account issued. This manual never contains account credentials.

3 Admin navigation overview

The sidebar is grouped by the job you're doing, not by how the software is built. Here is every group and what it controls.

GROUP	WHAT IT'S FOR	WHICH PUBLIC SECTION IT CONTROLS
Website Builder	How the site is presented — pages, header, footer, navigation, media, SEO, templates.	Every public page's chrome and structure.
Content records	Editorial pages, success stories, testimonials.	About/FAQ/listing-page content, the stories and testimonials sections.
Destinations	Continents, Countries, States/provinces, Cities.	The destinations/study-abroad section of the site.
Academics	Subjects, Generic courses, Course levels, Study modes, Intakes.	The subjects and courses section.
Universities	Universities, University course offerings, University claim requests.	The universities section and each institution's own page.
Scholarships	Scholarships, Scholarship providers.	The scholarships section.
Consultants	Consultants, Consultant locations.	The consultants section.
Enquiries and Counselling	Contact enquiries, Counselling leads.	Not public-facing — this is where visitor enquiries land.
Careers and events	Jobs, Events.	The careers and events sections.
Platform tools	Bulk import/export, Redirects, A/B experiments.	Operational tools; not a public section on their own.
Settings	General, Branding, Contact details, Social links, Header, Footer, Default SEO.	Site-wide configuration used across every public page.

4 Website Builder — module by module

Website Pages

[Website Builder](#) → [Website Pages](#)

What it controls: a single searchable list of every public page and shared template, with a direct link to each one's own editor and its own SEO settings.

When to use it: whenever you're not sure where a specific page's content lives.

Global Header

[Website Builder](#) → [Global Header](#)

What it controls: the navigation bar shown on every public page — logo, menu, announcement bar, and the primary call-to-action button.

Step-by-step: open the screen, edit a field, click Save. The change appears on every public page immediately.

Because this affects every page at once, double-check a change before saving.

Global Footer

[Website Builder](#) → [Global Footer](#)

What it controls: the footer on every public page — description, copyright line, counselling call-to-action, contact column, social links, and legal links (privacy/terms).

Navigation menus

[Website Builder](#) → [Navigation menus](#)

What it controls: the menu items, their order, and their links, that feed the Global Header and Footer.

Step-by-step: open a menu, add/reorder/deactivate items, Publish the menu when ready.

Page templates

[Website Builder](#) → [Page templates](#)

What it controls: one shared layout applied to every record of a given type (for example, every university's detail page), and reusable content sections that can be dropped into any page.

Important caution: assigning a template to a page only remembers which template it uses — it never changes that page's existing content. Applying the template's default sections is a separate action, and it skips any section the page already has, so it never duplicates content.

Media library

Website Builder → Media library

What it controls: every image and file available to use across the whole platform.

Step-by-step to upload: choose a file, optionally add a title and alt text, optionally choose a folder, click Upload.

How to delete safely: the library shows every page and record currently using a file before you can delete it — check that list first.

See Section 10 for accepted formats and size limits.

SEO management

Website Builder → SEO management

What it controls: a single hub linking to the SEO settings of every resource type and every code-defined route (listing pages, comparison pages, and static pages like Home/About/FAQ).

Public website impact: comparison pages default to "do not index" until you explicitly turn indexing on, since they're generated views rather than primary content.

Website Pages — every public page in one list.

Global Header settings.

Media library upload screen.

SEO management hub.

5 Content Records → Pages — complete chapter

This module gets its own full chapter because it's the one most easily misunderstood, and the one you'll use most often.

Website Builder → Website Pages vs. Content Records → Pages

These are two views of overlapping territory, not two separate systems:

- **Website Builder → Website Pages** is the master list of every public page and template, with quick links to each one's editor, SEO settings, preview, and version history.
- **Content Records → Pages** is where you actually edit a page's own content — title, slug, layout, status, SEO fields, header/footer overrides, and its content sections.

Do Content Records → Pages create new routes?

No. A Page record's slug only has somewhere to appear on the public site if a matching route already exists in the platform's code — a fixed list that includes pages like About, FAQ, and each catalogue's listing page (Countries, Universities, Courses, and so on). Typing a brand-new slug and saving stores the content correctly, but it will not create a new public URL on its own. Adding a genuinely new page type is a one-time development task, not something this screen does by itself.

Do they configure an existing route?

Yes — for the pages that already have one. Editing "About Us" changes what visitors see at [/about](#) ; editing "FAQ" changes [/faq](#) ; and so on for every page already listed in Website Pages.

How the slug is used

The slug is the web address segment for that page (for example, [about](#) for [/about](#)). Once a page is live, avoid changing its slug — see Section 13 for why.

How the layout is used

Every Page record has a Layout setting — Default, Editorial, or Landing. In the current build, all three currently render identically on the public site; there is no visible difference between them yet. The field saves correctly and is safe to leave as Default.

How content sections are attached

Below the core fields, a Page has a list of Sections — each with its own type (Hero, Rich text, CTA, Image, Image+text, Card grid, Stats, FAQ group, Related links, and several catalogue-directory types), heading, body content, its own status, and independent Desktop/Tablet/Mobile visibility. Add, reorder, duplicate, or remove sections from this list; click Save sections to commit them.

Draft and publishing behaviour

STATUS	EFFECT
Draft	Never visible on the public site.

Scheduled	Becomes visible automatically at the "Publish at" date/time you set.
Published	Visible now.
Archived	Never visible on the public site.

Scheduling and unpublishing

Set Status to Scheduled to reveal a "Publish at" field for a future go-live moment. Separately, the optional "Unpublish at" field takes an already-published page down automatically at a chosen time — useful for time-limited announcements or seasonal content.

SEO settings

Every Page has its own SEO title, meta description, canonical URL (optional), and focus keyword (optional) — see Section 9 for what each one does.

Header/footer inheritance and overrides

Every page inherits the site-wide Global Header and Footer by default. On this screen you can instead choose an Alternate variant (a different visual style using the same navigation and settings) or Hide the header and/or footer entirely, just for this one page. Choosing "Alternate variant" also reveals a second field — the specific variant style (compact/centered/minimal for the header, compact/minimal for the footer) — which must be chosen for the alternate style to actually take effect.

Preview behaviour

Use the "Preview" action from the Website Pages list to see a page's current state, including any changes not yet published.

Public URL behaviour and possible 404s

A page returns a "not found" result to visitors when either its slug doesn't match a route the platform recognises, or its Status isn't Published (and, if scheduled, its Publish-at time hasn't arrived yet).

6 Catalogue modules – complete chapter

Countries, Subjects, Universities, Courses, Scholarships, Consultants, Jobs, Events, Success Stories and Testimonials all share one working pattern, described once here.

The shared pattern

1. **Create:** click "Create record" (or the module's equivalent), fill in the required fields, save — the new record starts as Draft.
2. **Edit:** click Edit on any row, change fields, save.
3. **Preview:** most editors let you review content before publishing; for records already live, edits appear immediately once saved.
4. **Publish:** click Publish (from the list, or within the editor) once content is ready.
5. **Unpublish:** click Unpublish to remove a record from the public site without deleting it — it returns to Draft.
6. **Delete safely:** check the record isn't referenced elsewhere (e.g. a University with published Course Offerings) before deleting; unpublishing is usually the safer first step.

What makes each module distinctive

MODULE	DISTINCTIVE FIELDS
Countries	Continent, ISO codes, structured Cost/Work/Language/Statistics profiles, editorial "why study here" content, FAQs, consultant guidance cards, intakes.
Subjects	Icon/listing/hero media, sub-subjects.
Universities	Country, institution type, campuses, accreditations.
University course offerings	University + generic course pairing, campus, tuition, intakes, entry requirements.
Generic courses	Subject, course level, duration, credits, study modes; a separate editorial workspace for per-country availability, content sections, FAQs, and related courses.
Scholarships	Provider, amount, currency, deadline, eligible countries/universities/offerings.
Consultants	Locations, destination countries, services, languages, and an independent Verified switch (separate from Published).
Jobs	Department, employment type, location, remote status, application details.
Events	Start/end date and time, event type (offline/online/hybrid), venue/location, registration link.
Success stories / Testimonials	Quote/journey text, attribution, optional link to a country/university/offering.

Public website impact

Publishing a record makes it appear on its listing page and its own detail page immediately. Unpublishing removes both immediately.

Important cautions

- Consultants: Verified and Published are independent — verifying does not publish, and publishing does not verify.
- Universities: unpublishing a university also removes its course offerings from public view, since they're shown under the university's own page.

7 Field-by-field reference

Every field type used across the admin panel, in one place.

FIELD	REQUIRED?	WHAT TO ENTER	EXAMPLE	FRONTEND EFFECT	IMPORTANT NOTE
Name / Title	Required	The record's display name	"Bachelor of Computer Science"	Page heading, listing cards, links	Keep it clear and specific
Slug	Often optional	URL segment — lowercase, hyphenated	bachelor-computer-science	Forms the public URL	Avoid changing once published — see Section 13
Short description / summary	Usually required	One or two sentences	—	Listing card text, fallback meta description	Keep under ~160 characters where it doubles as SEO text
Overview / Description	Optional	Longer body text	—	Main content area of the detail page	—
Dropdowns (Status, Layout, etc.)	Varies	Choose from a fixed list	—	See Section 8 for every option's exact effect	Never leave a required dropdown at a placeholder value
Checkboxes / switches (Featured, Show X)	Optional	Tick to enable	—	Toggles a specific visual element or placement	—
Date/time fields	Optional	Pick a date and time	—	Governs scheduling (see Section 11)	Leave blank for "no limit"
Image uploads	Optional	Choose or browse existing media	—	Shown wherever that image slot renders	See Section 10 for size/format limits
Relation selectors (Country, University, etc.)	Varies	Choose an existing record	—	Links the two records together publicly	Only published records should usually be selected for a public-facing relation

SEO inputs	Optional	See Section 9	—	Search-engine and social-share appearance	—
Header/Footer selectors	Optional	Use Global, Alternate variant, or Hide	—	See Section 8	Alternate variant needs its own variant style chosen too
Buttons (Save, Publish, Preview, Delete)	—	Click when ready	—	Immediate — see Section 11	—

8 Every dropdown option explained

Never just "choose a suitable option" — here is what each one actually does.

Page Layout (Content Records → Pages)

OPTION	WHEN TO USE IT	WHAT CHANGES	LIMITATIONS
Default	Always safe to leave selected	Nothing currently — see limitation	All three options render identically today; there is no verified visual difference in the current build.
Editorial	Not yet meaningfully different	Nothing currently	Same as above.
Landing	Not yet meaningfully different	Nothing currently	Same as above.

Page Status

OPTION	WHEN TO USE IT	WHAT CHANGES
Draft	While content is being written or reviewed	Never visible to visitors
Scheduled	Content is ready but should go live at a specific future time	Reveals a "Publish at" field; stays hidden until then
Published	Content is ready now	Visible immediately
Archived	Content is retired but kept for reference	Never visible to visitors

Header / Footer selection

OPTION	WHAT CHANGES	LIMITATIONS
Use Global / inherited	Shows the site-wide Header or Footer, as configured in Settings.	None — this is the default and safest choice.
Alternate variant	Restyles the same admin-managed navigation. Requires choosing a specific variant style (compact/centered/minimal for the header; compact/minimal for the footer) to see any difference.	Selecting "Alternate variant" alone, without a variant style, looks identical to Use Global.
Disabled / Hide	Removes the header and/or footer entirely from that one page.	Use with care — visitors lose site navigation from that page.

SEO / indexing options

OPTION	WHAT IT DOES
Allow search engines to index this page	When off, asks search engines not to list the page in results. Unpublished drafts are never indexable regardless of this setting.
Allow search engines to follow its links	When off, asks search engines not to follow links found on that page.

9 SEO field explanations

FIELD	PLAIN-ENGLISH MEANING
SEO title	What shows as the page's title in a browser tab and in search results. Recommended length: roughly 50–60 characters — this is a recommendation, not a system-enforced limit unless stated otherwise.
Meta description	The short summary search engines typically display under your page's title. Recommended length: roughly 150–160 characters (a recommendation).
Canonical URL	Tells search engines which web address is the "real" one for this content, useful if the same content is reachable at more than one URL. Leave blank unless you have a specific reason.
Focus keyword	An internal note on the main search term this page targets — not shown to visitors or sent to search engines directly.
URL slug	The web address segment for the page or record — see Section 13 on why to keep it stable once published.
Social sharing (Open Graph) title/description/image	What appears when the page is shared on Facebook, LinkedIn, and similar platforms — set separately from the SEO title/description where available.

10 Image and media guidelines

ITEM	DETAIL
Supported formats	JPEG, PNG, WEBP, GIF — as stated directly on the Media library upload screen.
Maximum file size	5MB per file — as stated directly on the Media library upload screen.

Recommended dimensions, aspect ratio, and compression guidance below are general good practice, not limits enforced by the system, unless noted otherwise.

- **Recommended dimensions:** match the slot you're filling — a hero image benefits from a wide, high-resolution source (at least 1600px wide); a small icon or logo can be much smaller.
- **Recommended aspect ratio:** keep hero and listing images consistent across similar records so cards line up cleanly.
- **Compression:** compress photos before upload (most image editors and many free online tools do this) to keep pages loading quickly.
- **Alt text:** always fill in the optional Alt text field — it helps accessibility and search engines, and it's what shows if an image fails to load.
- **File naming:** use a clear, descriptive filename before upload (e.g. `ashcroft-college-campus.jpg` rather than `IMG_0231.jpg`).
- **Reusing existing media:** any image already uploaded can be picked from any media selector across the platform — no need to re-upload the same image for a different record.
- **Replacing images safely:** upload the new image as a new file, attach it to the record, confirm it displays correctly, then delete the old file only after checking it isn't still referenced elsewhere.
- **What happens when media is deleted:** the Media library shows every page and record currently using a file before deletion is allowed, specifically to prevent a live page ending up with a broken image.
- **Mobile considerations:** a wide desktop hero image is automatically scaled for smaller screens; very small or low-resolution source images can look blurry once scaled up on a phone, so start from a reasonably large source image.

11 Publishing workflow

Scheduled publishing

Set a record's status to Scheduled and choose a future "Publish at" date and time. The record becomes visible automatically, with no further action needed.

Scheduled unpublishing

Many modules also offer an optional "Unpublish at" (or equivalent end-of-window) date, which takes an already-published record down automatically at a chosen time.

Updating published content

Editing an already-published record updates the public page as soon as you save — there is no separate "republish" step for a record that's already live.

Reverting changes

For Page sections specifically, Version History lets you compare two versions and restore an older one; restoring creates a new version rather than deleting anything, and never publishes on its own.

Cache delay

Most pages update the moment you save. If a change doesn't appear immediately, a hard refresh (Cmd/Ctrl+Shift+R) rules out your own browser caching the old version before assuming anything else is wrong.

12 How records relate to each other

Only relationships that actually exist in the system are shown here.

Continent → Country

Country → State/Province → City

Country → University

University + **Generic Course** → University Course Offering

Country → FAQs (managed within the Country's own editorial workspace)

Generic Course → FAQs (managed within the Course's own editorial workspace)

Page → Sections (content blocks)

Navigation menu → Global Header / Global Footer

Page → Header/Footer override (optional, per page)

Scholarship → eligible Countries / Universities / Offerings (many-to-many)

Consultant → Locations, destination Countries (many-to-many)

13 Best practices

- Always preview before publishing.
- Keep slugs short and stable — once a page or record is live and possibly linked to from elsewhere, changing its slug changes its public URL and can break existing links and search-engine rankings.
- Do not frequently change a published URL.
- Compress images before uploading.
- Fill in SEO title and meta description for every important page — don't leave them blank.
- Use meaningful, specific titles rather than generic ones.
- Avoid creating duplicate records for the same real-world thing (e.g. two records for the same university).
- Always check the mobile view of any change before considering it done.
- Do not delete a linked record (e.g. a University with published course offerings) without checking what depends on it first — unpublish rather than delete when in doubt.
- Use Draft status while content is still under review, and only move to Published when it's ready for visitors.

14 Common mistakes

MISTAKE	HOW TO PREVENT IT
Publishing incomplete content	Use Draft while writing; only switch to Published when the content is genuinely ready.
Duplicate slug	Search the existing list before creating a new record with a similar name.
Incorrect parent country/university selection	Double-check the relation field before saving, especially on records with many similar options.
Uploading very large images	Compress before upload; stay within the 5MB limit.
Leaving SEO fields blank	Fill in SEO title and meta description for every page that matters for search visibility.
Changing a live URL	Avoid editing a slug once the page is published and linked elsewhere.
Deleting media still in use	Check the Media library's "in use" list before deleting any file.
Setting the wrong unpublish date	Double-check the date and time zone before saving a scheduled unpublish.
Selecting an incorrect layout	Layout currently has no visible effect (see Section 8), so this specific choice is low-risk today — but form the habit anyway.
Assigning the wrong header/footer	Remember Alternate variant needs its own variant style chosen to look different at all.
Forgetting to publish after saving	Saving a Draft does not make it visible — check Status before assuming a change is live.

15 Frequently asked questions

Can I create a new page myself?

Yes, in Content Records → Pages. Whether it appears at a new public web address depends on whether that address already has a route set up — see Section 5.

Can I save my work without making it public?

Yes — leave Status set to Draft. Nothing goes live until you change it to Published (or Scheduled) and save.

Can I schedule a page or record to go live automatically?

Yes — set Status to Scheduled and choose a "Publish at" date and time.

Can I schedule something to come down automatically?

Yes — use the "Unpublish at" field where available.

Can I control how a page looks on search engines separately from its content?

Yes — every page and most records carry their own SEO title, meta description, canonical URL and indexing controls.

Can different pages use different headers and footers?

Yes, per page, independently for header and footer.

Can I undo a change?

For page sections, yes — Version History lets you compare and restore. For a record's core fields, there's no one-click undo, so it's worth reviewing before saving.

Can I reuse an image I've already uploaded?

Yes, from any media picker across the platform.

What image sizes should I use?

See Section 10.

Can I reorder the navigation menu?

Yes, in Navigation menus.

Can I preview before publishing?

Yes, for most modules — use the Preview action where offered.

Will my changes show up on mobile right away?

Yes — it's the same content and the same publish action; there's no separate mobile step.

What happens if I enter a slug that doesn't match any real page?

The record saves correctly, but nothing appears publicly at that address — see Section 5.

16 Getting help

What you can resolve yourself

- Content edits, publishing/unpublishing, scheduling.
- Uploading and managing media.
- SEO field edits.
- Navigation reordering.

What requires administrator access

- Anything requiring a login you don't have.
- Global Settings, Global Header/Footer changes for site-wide branding decisions.

What requires developer support

- Adding a genuinely new page route (a URL with no existing page behind it).
- Any error message that doesn't match the situations described in this manual.
- Anything related to hosting, domains, or email delivery.

What to provide when reporting an issue

- The exact page or record you were working on.
- The exact steps you took.
- A screenshot of any error message.
- The date and time it happened.
