

INTERNAL · NOT FOR THE CLIENT

Phase 1 Internal Demo & Training Guide

A complete, step-by-step operational guide for running the full client demonstration — every module, every field, every button — without needing the developer in the room.

CONTAINS INTERNAL-ONLY NOTES — DO NOT FORWARD

Document version 1.0 · Prepared August 2026 · Verified live against production

Contents

1. Demo preparation checklist	3
2. Recommended demo sequence	6
3. Detailed demo script, module by module	7
4. Every Content Records → Pages field explained	22
5. Demo talking points	24
6. Common client questions and answers	25
7. Troubleshooting	27
8. Demo timeline	29
9. Internal notes — read before every demo	30
10. Screenshot reference	32

Everything in this document was checked directly against the live production system on the preparation date above — every field name, every dropdown option, and every stated effect. Where an option's visual effect could not be confirmed, that is stated plainly rather than guessed at (see Section 3.4 and Section 9).

1 Demo preparation checklist

Do this 15–20 minutes before the client joins, every time — even for the fifth demo. State always drifts (someone leaves a draft open, a record gets unpublished for testing) and this catches it.

Access

ITEM	DETAIL
Admin URL	https://admin.54.162.49.131.nip.io
Public site URL	https://54.162.49.131.nip.io
Required login role	Super Admin — the only role Phase 1 has. There is no separate "editor" or "viewer" role yet; whoever signs in has full access.
Where the credentials live	Issued to you separately (password manager or a secure message from the developer). This guide deliberately never contains them.

Browser and device

- ☐ Use Chrome or Edge at a normal laptop resolution (1440×900 or similar). Safari works but Chrome's dev-tools device toolbar makes the mobile moment easier.
- ☐ Sign in to the admin console in a **second browser tab or window** before the call starts — so you never type a password on screen.
- ☐ Have a phone-sized window ready in advance: resize the browser to ~390×844, or open Chrome DevTools → the device toolbar (Cmd+Shift+M) and pick "iPhone 12 Pro" or similar.
- ☐ Close unrelated tabs, the bookmarks bar, and any terminal or code editor window before sharing your screen.

Pages to have open before the meeting

- ☐ Public homepage (also the Countries listing — the two are the same page).
- ☐ Admin Dashboard.
- ☐ Admin → Content Records → Pages, with "About Us" visible in the list (this is the record you'll use for the round-trip demo).
- ☐ Admin → Universities, with at least one real published university visible (for the catalogue-management moment).

Dummy / demo records that should already exist

The seeded catalogue currently includes 12 countries, 12 generic courses, 5 subjects, and a small number of universities, scholarships, consultants, jobs and events — enough to demonstrate every listing and filter live. Some records are obviously placeholder/fictional (names that read like test data) — say once, early in the public-site walkthrough, that the catalogue is demo data. Do not present a fictional record as if it were a real institution.

What must be checked before the client joins

- ☐ Open `/about` on the public site and confirm it loads normally — this is the page you'll edit live.
 - ☐ In the admin, confirm "About Us" (Content Records → Pages) shows Status = **PUBLISHED** and Layout = **default**. If either was left in a different state from a previous test, it must be corrected before the call — see the restore steps below.
 - ☐ Confirm no draft section is left half-added on "About Us" from a previous rehearsal — reload the edit screen and check the Sections list is exactly what you expect.
 - ☐ Confirm the university you plan to publish/unpublish live is currently **published** (so the demo begins from a known state).
-

What should NOT be modified during the demonstration

Never edit Global Settings, Global Header/Footer, or Navigation Menus live as an experiment "to see what happens" — these affect every page on the site simultaneously, for every visitor, the instant you save. If you want to demo a header/footer change, change the CTA label, show it, then change it straight back before moving on (see the module script in Section 3).

Never delete a real client record. If you need a disposable record to demonstrate delete/archive behaviour, create one yourself first (e.g. a scholarship named "DELETE ME — demo") and delete that.

How to avoid accidentally publishing incorrect content

Every catalogue record and every Page defaults to **Draft** when created — nothing goes live until you explicitly change its status and save. The two things that catch people out:

- Editing an *already-published* record: your edits become visible on the public page as soon as you save, no separate "publish" step — because the record is already public. If you're not sure a record is meant to be edited live, check its status first.
- A page's **Layout** dropdown (default/editorial/landing) and its **Header/Footer override** can be changed without touching Status at all — a live page can be visually altered without ever leaving "Published". Always check what you changed before you leave the screen.

How to verify whether a change is actually live

1. Save in the admin.
2. Switch to the public tab and hard-refresh (Cmd/Ctrl+Shift+R) — the CMS pages route is intentionally rendered fresh on every request, so a normal refresh is enough; a hard refresh just rules out any browser-level caching on your own machine.
3. If it isn't there, check the record's Status first (still Draft/Scheduled?), then check any "Publish from/until" or "Unpublish at" scheduling window before assuming something is broken.

Backup and restore precautions

INTERNAL ONLY — do not share with client: Content Records → Pages has no one-click "undo" for the core fields (Title/Slug/Layout/Status) — only Version History for sections. Before changing About Us's Layout or Header/Footer for the demo, mentally note the original values (Layout: `default` , Header: `Use Global` , Footer: `Use Global`) so you can put them back by hand afterwards. This guide's own verification pass changed and restored these exact fields once already — see Section 9.

2 Recommended demo sequence

Matched to what actually exists in this Phase 1 build — a few items from a generic template (like a separate "User and permission management" screen) don't apply here and are called out rather than skipped silently.

1. Sign-in and Dashboard overview
2. Public site walkthrough (destinations, universities, courses, comparison)
3. Website Builder → Website Pages (the "everything lives in one list" moment)
4. Content Records → Pages: the full round trip (write → preview → publish)
5. Version history (compare and restore)
6. Page templates (change one, watch every page of that type follow)
7. Global Header
8. Global Footer
9. Navigation menus
10. Media library
11. SEO management
12. Catalogue management: Countries, Universities, Courses (pick 2, live publish/unpublish)
13. Success Stories / Testimonials (fast)
14. Contact enquiries → Counselling leads conversion
15. Bulk import/export (only if asked about data volume)
16. Responsive/mobile verification
17. Access model — who can sign in, what happens on a wrong password (talking point only, don't actually lock the account)
18. Closing summary and next steps

Not included, because Phase 1 doesn't have it: a separate Users/Roles management screen (item 21 of a generic template). Say so directly if asked — see Section 6.

3 Detailed demo script, module by module

Read this section directly during the meeting. Each module follows the same shape: what it is, where it lives, exactly what to click, what to say, and what to do if something looks wrong.

3.1 Dashboard

What / why	The admin landing screen. Confirms who's signed in and their role, and links to the most-used screens.
Who uses it	Every admin, as their entry point.
Where	Sidebar → Dashboard (top item).

SAY: Everything you manage lives in this sidebar, grouped by the job you're doing, not by how the software is built underneath.

The screenshot shows the Universta Admin Workspace. The sidebar on the left is dark blue with white text. It has a top section 'ADMIN ROLE' with a '1' in a circle, followed by 'Dashboard'. Below is 'WEBSITE BUILDER' with links: Website Pages, Global Header, Global Footer, Navigation menus, Page templates (with a sub-note 'Reusable sections are managed here'), Media library, and SEO management. Then 'CONTENT RECORDS' with: Pages (with a sub-note 'Page sections / content blocks are managed here'), Success stories, and Testimonials. Finally 'DESTINATIONS' with 'Continents'. The main content area is light grey. At the top, it says 'ADMIN WORKSPACE Overview'. On the right, it shows the user 'Demo Administrator' with email 'demo-admin@universta.com' and role 'SUPER_ADMIN'. A large blue banner says 'Good to see you, Demo.' with a sub-note 'Everything you manage lives in the sidebar, grouped by area. The quick links below jump straight to the resources you use most.' Below the banner are two white boxes: 'Account email: demo-admin@universta.com' and 'Active role: SUPER_ADMIN'. Underneath is a 'WEBSITE BUILDER' section with a grid of links: Website Pages, Global Header, Global Footer, Navigation menus, Page templates (highlighted with a blue border and sub-note 'Also manages Reusable sections'), Media library, and SEO management. At the bottom is a 'CONTENT RECORDS' section with links: Pages (with sub-note 'Also manages Page sections / content blocks'), Success stories, and Testimonials.

① The sidebar — every module grouped by task (Website Builder, Content records, Destinations, Academics, Universities, Scholarships, Consultants, Enquiries and Counselling, Careers and events, Platform tools, Settings).

3.2 Website Builder → Website Pages

What it does	Lists every public page and template in one place, with a link straight to each one's own editor.
Why it exists	So nobody has to remember a URL or hunt through the sidebar to find where a specific page's content lives.

Where

Sidebar → Website Builder → Website Pages (/website).

Click through: open Website Pages, point out the search box and the list of every page with its management type.

SAY: All of the platform's public pages are in this one searchable list. Your team never has to know a web address to edit a page.

The screenshot shows the 'Website Pages' management interface in the Universta admin console. The left sidebar contains navigation links for 'ADMIN CONSOLE', 'Dashboard', 'Website Builder' (selected), 'Global Header', 'Global Footer', 'Navigation menus', 'Page templates', 'Media library', 'SEO management', 'Content Records', 'Pages', 'Success stories', 'Testimonials', and 'Destinations'. The main content area is titled 'Website Pages' and includes a search bar, filters for 'Page family' and 'Managed as', and a table of 33 pages. The table columns are PAGE, FAMILY, MANAGED AS, STATUS, and ACTIONS. The table lists five pages: Home, About Us, Contact Us, Book Free Counselling, and FAQ, all with a 'PUBLISHED' status and links to 'Open in Builder', 'SEO', 'Preview', 'History', and 'View live'.

PAGE	FAMILY	MANAGED AS	STATUS	ACTIONS
Home / · 1 section	Core	Static page — full section editor	PUBLISHED	Open in Builder SEO Preview History View live
About Us /about · 6 sections	Core	Static page — full section editor	PUBLISHED	Open in Builder SEO Preview History View live
Contact Us /contact · 0 sections	Core	Functional page — configurable blocks around the form	PUBLISHED	Open in Builder SEO Preview History View live
Book Free Counselling /counselling · 0 sections	Core	Functional page — configurable blocks around the form	PUBLISHED	Open in Builder SEO Preview History View live
FAQ /faq · 0 sections	Core	Static page — full section editor	PUBLISHED	Open in Builder SEO Preview History View live

The Website Pages list — every public page, its management type, and a link to its own SEO settings.

3.3 Content Records → Pages — the full round trip

This is the centrepiece of the demo. Full field-by-field detail is in Section 4; this is the script to read aloud while you do it.

Sidebar → Content records → Pages. Click **Edit** on "About Us".

Careers Listing	careers-listing	Edit Publish Unpublish Archive
Testimonials	testimonials-listing	Edit Publish Unpublish Archive
Success Stories	success-stories-listing	Edit Publish Unpublish Archive
Consultant Comparison	compare-consultants	Edit Publish Unpublish Archive
Course Comparison	compare-courses	Edit Publish Unpublish Archive
University Comparison	compare-universities	Edit Publish Unpublish Archive
Country Comparison	compare-countries	Edit Publish Unpublish Archive

The Page form's top half: Title, Slug, Short description, Layout, Status, Unpublish at, and the SEO fieldset.

1. Scroll to the Sections list at the bottom. Click **Add section**, give it a heading (e.g. "Why we exist"), pick a type (Rich text is the simplest to demo), type a sentence of body text.
2. Turn off "Show on Mobile" for that section (per-breakpoint visibility toggles sit next to each section).

SAY: The same page can show a section on desktop and hide it on a phone.

3. Click **Save sections**.
4. **Switch to the public /about tab and refresh.** The new section is *not* there.

SAY: Nothing you just did touched the live page yet — that's deliberate.

Content Records → Pages does not have a separate "Preview" button distinct from the public page itself for already-published pages — because About Us is already Published, its sections save and appear on the live page together (see the honest note below). Do not promise a private preview link for this specific screen unless you've confirmed one exists for the record you're demoing.

SAY: That's the round trip: write it here, and it's under your control the whole time — nothing changes for a visitor until you decide it should.

Undo: remove the section you just added (Remove button next to it in the Sections list) and click Save sections again, restoring the page to how it was before the demo.

Field-level notes for this screen (say if asked)

SAY: Layout has three choices — default, editorial, landing — but changing it doesn't visibly change this page in the current build. It saves correctly; there's simply no visual template difference wired up for it yet in Phase 1.

SAY: Header and Footer here can be set to Use Global, an Alternate variant, or Hidden, independently of each other. Alternate variant needs its own "variant" style picked (compact / centered / minimal for the header; compact / minimal for the footer) — until a variant is chosen, "Alternate variant" looks identical to Use Global.

3.4 Version history

What it does	Every save is recorded. You can compare two versions and restore an older one.
Where	Inside a Page's own edit screen (Version History control near the section editor).

SAY: Restoring creates a new version — it never deletes history, and it never publishes anything by surprise.

3.5 Page templates

What it does	One shared layout used by every record of a given detail-page type (e.g. every university page). Also manages reusable sections that can be dropped into any CMS page.
Where	Sidebar → Website Builder → Page templates (/page-templates).

SAY: Assigning a template to a page only remembers which one it uses — it never changes the sections that page already has. Applying the template's default sections is a separate, deliberate action, and it skips any section the page already has, so it can't silently duplicate content.

3.6 Global Header

What it does The navigation bar shown on every public page — logo, menu, announcement bar, primary call-to-action.

Where Sidebar → Website Builder → Global Header (/website/header).

Change the primary CTA label, save, switch to the public site and refresh (any page — it's global), then change it straight back and save again.

SAY: One edit, every page. But that's exactly why we don't experiment on this screen mid-demo — change it, show it, put it back.

3.8 Navigation menus

What it does	The menu structure the Global Header/Footer draw from — labels, links, order, and a Publish/Unpublish state per menu.
Where	Sidebar → Website Builder → Navigation menus (/phase1/navigation-menus).

INTERNAL ONLY — do not share with client: The Navigation-menu picker (used, for example, when setting a page's header override to "Alternate variant") currently lists several stray test menus alongside the real ones — names like `probe-menu-x1` and `qa-nav-711131`. These are leftover QA fixtures from earlier testing, not real client menus. Do not select one during a demo; stick to the named menus (Primary, Header, Footer). Flagged for clean-up — see Section 9.

3.9 Media library

What it does

Every uploaded image/file, with an "in use" check showing everywhere a file is currently referenced before you can delete it.

Where

Sidebar → Website Builder → Media library (/media).

SAY: Before you delete anything here, this screen tells you exactly which pages and records are using it — so you can't accidentally break a live page's image.

3.10 SEO management

What it does

A single hub linking to every SEO-enabled resource and every code-defined route's own SEO settings (title, meta description, canonical, indexing).

Where

Sidebar → Website Builder → SEO management (/seo).

PLATFORM TOOLS

SEO management

SEO title, meta description, canonical URL, Open Graph image and robots directives are edited inline within each resource's own editor rather than a separate global form, so changes stay next to the content they describe. Every SEO-enabled resource type is listed here so nothing is left undiscoverable.

Countries

Open a country, use its SEO tab (title, description, canonical, OG, hreflang, schema).

Cities

Open the Cities tab, use the "SEO" action on any row.

Universities

Edit a university, use the SEO section of the structured editor.

University course offerings

Edit an offering, use the SEO section of the structured editor.

Scholarships

Edit a scholarship, use the SEO section of the structured editor.

Consultants

Edit a consultant, use the SEO section of the structured editor.

Consultant locations

Use the "SEO" action on any location row.

Jobs

Edit a job, use the SEO section of the structured editor.

Events

Edit an event, use the SEO section of the structured editor.

Success stories

Edit a story, use the SEO section of the structured editor.

3.11 Countries, Universities, Courses (catalogue management)

Pick two of these three for a live demo — showing all three back-to-back slows the meeting down without adding a new idea.

Universities: open a real published university, edit its Description field, save, show the change on its public page, click Unpublish, show the public page now 404s / disappears from the listing, click Publish again to restore it.

SAY: Publication is a switch your team controls. Nothing goes live by accident, and nothing stays live when you need it down.

3.13 Contact enquiries → Counselling leads

What it does

A submitted contact-form enquiry can be converted into a counselling lead, with status history attached.

Where

Sidebar → Enquiries and Counselling → Contact enquiries / Counselling leads.

Submit a contact enquiry on the public site. Find it under Contact enquiries. Convert it into a lead. Try converting the same enquiry a second time.

SAY: It won't create a duplicate lead — one enquiry becomes exactly one lead.

3.15 Redirects and A/B experiments

Mention briefly if the conversation turns to SEO/marketing. Redirects forward an old URL to a new one automatically. A/B experiments is a platform tool for testing CTA variants — demo only if specifically asked, since it's not part of the core content story.

URL MANAGEMENT

Redirects

Manage source-to-target URL redirects. Automatic redirects created when a resource's slug changes appear here too and can be edited or disabled the same way.

Create a redirect

Redirects must be created (start with a single "/") - external URLs are rejected to prevent open redirects. A target that is itself the source of another active redirect is also rejected, so chains may fail.

Source path

Target path

HTTP status

301 (permanent)

Create redirect

4 Every Content Records → Pages field explained

This is the module the client will ask about most, so it gets its own complete field table here rather than a summary. Verified directly on the live "About Us" record.

FIELD	TYPE	WHAT IT DOES / SAY IF ASKED
Title	Text	Display name for internal reference and, where used, the page heading.
Slug	Text	The URL segment. For this module, changing or entering a slug does not create a new live route by itself — see the important note below.
Short description	Textarea	Optional summary text, used where the page type reads it (e.g. as a fallback meta description).
Layout	Dropdown: default / editorial / landing	Stored successfully; no verified visual difference was found in the current Phase 1 frontend for any of the three values (confirmed by directly toggling all three on the live "About Us" page and comparing screenshots pixel-for-pixel — identical). Say so honestly if asked; do not claim a difference.
Status	Dropdown: DRAFT / SCHEDULED / PUBLISHED / ARCHIVED	Controls visibility. DRAFT and ARCHIVED are never publicly visible. SCHEDULED reveals a "Publish at" date/time field (see below) and stays hidden until then. PUBLISHED is live now, subject to the optional "Unpublish at" below.
Publish at	Date/time — only shown when Status = SCHEDULED	The moment this page becomes publicly visible.
Unpublish at (optional)	Date/time	If set, the page automatically stops being publicly visible at this moment, even while Status still says Published in the admin.
SEO title	Text	Overrides the page's browser-tab/search-result title.
Meta description	Text	Overrides the search-result snippet.
Canonical URL (optional)	Text	Tells search engines which URL is authoritative for this content — leave blank unless there's a specific duplicate-content reason to set it.
Focus keyword (optional)	Text	Editorial reference for the SEO team; not shown to visitors.
Header selection	Dropdown: Use Global / Alternate variant / Hide	Use Global inherits the site-wide header (the default). Alternate variant restyles the same admin-managed navigation — it needs a second "Header variant" dropdown (default/compact/centered/minimal) to actually look different; confirmed live that "compact" measurably tightens the header's horizontal spacing. Hide removes the header entirely from this page.
Footer selection	Dropdown: Use Global / Alternate variant / Hide	Same pattern as Header, with footer variants default/compact/minimal.

Show the announcement bar / primary CTA / footer CTA / counselling CTA	Checkboxes	Independent visibility toggles layered on top of the Header/Footer selection above.
CTA label override / CTA destination override	Text	Leave blank to use the Global label/destination; fill in to override just for this page.
Page template (assignment)	Dropdown + two buttons	"Save assignment" only remembers which template this page uses — it never touches existing sections. "Apply template's default sections" is a separate action and skips any section this page already has, so it's safe to click without duplicating content.
Sections (Add section)	Repeatable block editor	Each section has a Type (Hero, Rich text, CTA, Image, Image+text, Card grid, Stats, FAQ group, Related links, and several directory types), a heading, body content, a Status (Draft/Scheduled/Active/Archived), and per-breakpoint Show on Desktop/Tablet/Mobile toggles.
Save page / Save sections / Preview / Close	Buttons	Save page commits the core fields (Title through Header/Footer/Template). Save sections commits the content blocks. There is no separate confirmation dialog for either — both save immediately.
Publish / Unpublish / Archive (list screen)	Buttons	Quick actions from the Pages list without opening the full editor.

Slug and routing — the one thing not to get wrong with a client. Content Records → Pages records a fixed set of known slugs that specific public routes already look for (about, faq, countries-listing, events-listing, and so on). Typing a brand-new, never-used slug into this field and saving does **not** make a new page appear anywhere on the public site — there is no general-purpose "/pages/{slug}" route that reads an arbitrary slug. If a client asks "can I just type a new page name and have it go live," the honest answer is: new page types are added by a developer wiring up a route; this screen edits the content and SEO for pages that already have one.

5 Demo talking points

Content management without a developer

Simple explanation: every public page's text, images, and search-engine settings are edited in the admin console and go live the moment you publish.

Business benefit: marketing and content changes ship in minutes, not sprints.

Client-facing example: changing the homepage headline or the header's call-to-action button.

Included in Phase 1: full section-based editing, draft/publish, version history, responsive per-section visibility.

Not included in Phase 1: a rich free-text/WYSIWYG editor for arbitrary new page layouts, or a way to create a wholly new route without developer work.

Possible Phase 2: a general-purpose page builder that can create new routes from the admin directly.

One catalogue, everywhere it's used

Simple explanation: a university's tuition, an offering's intake dates, a scholarship's amount — each lives in one record and appears correctly on every page that references it.

Business benefit: no stale duplicate data across pages.

Included: Countries, Universities, Courses, Offerings, Scholarships, Consultants, Jobs, Events, with filters and comparisons.

Not included: student-facing accounts, ratings/rankings (deliberately — the platform holds no such data), payment processing.

Publishing is a deliberate switch

Simple explanation: nothing is visible to a student until an admin explicitly publishes it, and it can be taken down again just as easily.

Business benefit: confident editing — mistakes are reversible, drafts are private.

6 Common client questions and answers

Answers below reflect the actual, verified implementation — not the generic template answer.

Can the client create a new page?

They can create a new Content Records → Pages record and fill in its content and SEO. Whether it appears as a new live URL depends on whether a matching route already exists in the code (see Section 4's routing note) — this is the one nuance to be upfront about.

Does entering a new slug automatically create a route?

No. Only a fixed set of already-wired slugs (about, faq, the various "-listing" pages, etc.) have a live public route reading them. A brand-new slug saves successfully but has nowhere to appear.

Can content be saved without publishing?

Yes — Status defaults to Draft, and a record stays private until Status is changed to Published (or Scheduled) and saved.

Can a page be scheduled?

Yes — set Status to Scheduled and a "Publish at" date/time field appears. The page becomes visible automatically at that moment.

Can a page be automatically unpublished?

Yes — the optional "Unpublish at" field takes it down automatically at a chosen time, independent of the Status field.

Can SEO fields be managed separately?

Yes — every page and most catalogue records carry their own SEO title, meta description, canonical URL, focus keyword, and indexing controls, editable inline with the record.

Can different pages use different headers and footers?

Yes, per-page — Use Global (default), an Alternate variant (compact/centered/minimal), or Hide entirely; independently for header and footer.

Can deleted content be restored?

Sections have Version History with Compare and Restore. The Page record's core fields (Title, Slug, Layout, Status) do not currently have a version history of their own — only the sections do.

Is revision history available?

Yes, for page sections specifically (see above).

Can the same media be reused?

Yes — the Media library is shared across every module; any uploaded image can be picked from any media selector.

What image sizes should be uploaded?

See the client manual's media guidelines chapter for the verified limits; don't guess a number here without checking that document first.

Can the navigation order be changed?

Yes — Navigation Menus supports reordering items and marking them active/inactive.

Can content be previewed before publishing?

Draft sections are visible in the admin's editing screen; whether a distinct device-framed preview exists depends on the specific screen — confirm before promising it for a module you haven't personally checked that day.

Will changes immediately appear on mobile?

Yes — it's the same content and the same publish action; there's no separate mobile deployment step. Per-section "Show on Mobile" toggles control what a phone visitor sees, independent of desktop.

Which users can publish content?

Any signed-in admin — Phase 1 has one role (Super Admin) with no publish-approval workflow between roles yet.

What happens if two admins edit the same page?

Not something to demonstrate live; if asked, say the platform is actively used by one admin at a time in this phase and note it as a question for the developer rather than guessing at conflict-resolution behaviour you haven't verified.

How are countries, universities and courses connected?

A University belongs to a Country. A University Course Offering links one University to one generic Course, and that's the record that actually carries tuition/intake/entry-requirement detail for that specific pairing.

How are FAQs assigned?

Country FAQs are managed from within the Country's own editorial workspace (noted right in the sidebar under Countries); Course FAQs live in the Course's own editorial workspace.

What happens when an incorrect slug is entered?

The record still saves; if the slug doesn't match a route the platform already knows about, nothing public breaks — the content simply has nowhere to display. See the troubleshooting section for the duplicate-slug case specifically.

7 Troubleshooting

SITUATION	POSSIBLE REASON	QUICK CHECK	SAFE SOLUTION	WHEN TO CALL THE DEVELOPER
Save button does nothing	A required field is empty, or the click didn't register	Scroll up — look for a red error banner near the top of the form	Fill the missing field and try again	If no error shows and nothing happens after two tries
Validation error	A field failed a rule (e.g. required field blank)	Read the exact message — it names the field	Correct that field and resave	If the message doesn't make sense for the field shown
"Slug already exists"	Another record already uses that slug	Search the list for the existing slug	Choose a different, unique slug	Only if you're certain no duplicate exists
Image does not appear	Not yet attached to this record, or upload failed silently	Reopen the media picker and confirm the file is listed	Re-select it explicitly and save again	If the file is missing from the Media library entirely
Old content is still visible	Browser cache, or the record wasn't actually saved	Hard-refresh (Cmd/Ctrl+Shift+R) the public page	Confirm Save succeeded (look for a success message) and hard-refresh again	If a hard refresh still shows the old content
Browser cache issue	Local browser cache	Try an incognito/private window	Hard-refresh or clear the site's cache for that origin	Rarely needed
Content is saved but not published	Status is still Draft/Scheduled	Check the Status field	Change Status to Published and save	Not needed
Incorrect header/footer appears	A per-page override is set (Alternate variant/Hide)	Open the page's Header/Footer fields	Set both back to Use Global unless the override is intentional	Not needed
Mobile view looks different than expected	A section's "Show on Mobile" toggle is off	Check that section's visibility toggles	Re-enable the breakpoint that should show it	Not needed
Page returns 404	The slug doesn't match any wired route, or the record isn't published	Confirm the exact public URL and the record's Status	See the routing note in Section 4 — this may be expected behaviour, not a bug	If a page that used to work now 404s
Scheduled content is not visible yet	The "Publish at" time hasn't arrived	Check the scheduled date/time against the current time	Wait, or bring the date/time forward if this is a rehearsal	Not needed
User does not have permission	Not signed in, or session expired	Check the top-right account chip	Sign in again	Not needed

API / server error	Backend issue	Note the exact error message and time	Retry once after a minute	If it recurs — bring the exact message
Session expired	Long idle time	You'll be returned to the login screen	Sign in again — your unsaved changes may be lost, so save often	Not needed
Upload failed	File too large, wrong format, or a network blip	Check the file size/format against the media guidelines	Compress/convert and retry	If a correctly-sized, correct-format file still fails
Wrong image aspect ratio	Source image doesn't match the slot's expected shape	Compare against the media guidelines chapter	Crop before uploading	Not needed
Draft content accidentally published	Status changed without noticing	Check Status immediately	Set back to Draft and save — the public page updates immediately once you do	Not needed, but flag it to the team

8 Demo timeline

SEGMENT	SUGGESTED TIME
Introduction	3 min
Public website overview	5 min
Admin panel overview (Dashboard, sidebar)	5 min
Content management demo (Pages round trip, version history, templates)	20 min
Destination and university data demo (Countries, Universities, Courses)	15 min
SEO and publishing demo	10 min
Client practice / content upload	15 min
Questions and next steps	10 min
Total	≈ 83 min

Trim the practice segment first if the meeting is running long — it's valuable but the least likely to be missed if cut.

9 Internal notes — read before every demo

Everything below is for you, not the client. It never appears in the client-facing manual.

Known limitations to steer around

INTERNAL ONLY — do not share with client: The Layout dropdown (default/editorial/landing) on Content Records → Pages has no visual effect in the current build — confirmed by directly toggling all three values on the live "About Us" page and finding pixel-identical rendering, and confirmed in the frontend source (the stored field is never read by any page component). Do not demo it as if it changes the page's appearance.

INTERNAL ONLY — do not share with client: The Header/Footer "Alternate variant" override does have a real, working visual effect — but only once a second "variant" value (compact/centered/minimal) is explicitly chosen. Selecting "Alternate variant" alone, without picking a variant, looks identical to "Use Global". This is easy to demo incorrectly if you don't select the variant field too.

INTERNAL ONLY — do not share with client: A junk test record ("hvhjhj", slug "/lk") is currently live in the Universities list from earlier testing. Do not click into it during a demo; use a real, named university instead. It is the client's own production data and has not been deleted without their sign-off.

INTERNAL ONLY — do not share with client: Listing-type editorial pages (Events Listing, Careers Listing, Testimonials, and several others) can have their own CMS sections saved successfully in the admin, but those sections are not currently rendered on the live listing route — only the two fully static pages (About, FAQ) render their sections. If a client adds content to "Events Listing" and asks why it isn't showing on </events>, this is the reason; it is a known, logged gap, not something you broke.

INTERNAL ONLY — do not share with client: The Navigation-menu picker (used by the per-page Header/Footer override) currently lists several stray QA test menus ([probe-menu-x1](#) , [qa-nav-711131](#) , and similar) left over from earlier acceptance testing. Avoid selecting them in a demo.

INTERNAL ONLY — do not share with client: There is no separate Users/Roles management screen. One hardcoded Super Admin role exists, with a single seeded account for this environment. If asked for a second admin account with restricted permissions, that is a Phase 2 conversation, not something to attempt to configure live.

Workarounds

INTERNAL ONLY — do not share with client: If you need to demonstrate "delete", create a disposable record first (clearly named, e.g. "DELETE ME — demo") rather than risking a real client record.

Areas not to demonstrate unless specifically asked

- A/B experiments — functional but not part of the core content story; opening it invites questions about a feature that needs its own separate walkthrough.
- Redirects — useful but a niche, technical feature for most client audiences.

- Bulk import/export's CSV/XLSX internals — show the buttons exist; don't walk through an actual large import live unless asked.

Features that require technical support

- Adding a genuinely new page route (a URL with no existing code behind it).
- Wiring Listing-page sections to actually render (the known gap noted above).
- Any DNS, hosting, or infrastructure question.

Features planned for a possible future phase

- A second admin role with restricted permissions.
- A general-purpose page builder that can create new routes without developer work.
- Student accounts (the "Create account" link exists in Global Footer/Header settings but is deliberately hidden until a destination URL is configured).

10 Screenshot reference

Full-size, current screenshots of every screen referenced above, captured directly from the live system on the preparation date.
